

Proejct Unity

Chapter 17

A Final Answer

It seems quite amazing that we would attempt to define the relative condition of universe without including an underlying force capable of sustaining and perpetuating the continuance of universe.

Equally amazing is the lack of explanation concerning a factor of force determining the form and function of all physical structure, in terms of atoms, molecules, cells etc. or the existence of an underlying force capable of sustaining the continuance of form and function.

In other words we have explained everything in terms of how things appear to function without considering why the actual form or why the actual function of those things we have explained should be possible in the first place.

Consequently it is assumed the universe is capable of sustaining and perpetuating itself without an underlying force, whereby it is possible to present a rationalized concept of universe based on a physical analysis of the existing condition without having to explain why even the most elementary elements of universe exist or why they continue to exist.

It is obvious that the elements of universe do continue to exist just as it is obvious that we continue to exist, but to ignore why this should be possible paints a rather superficial picture of our existence.

Therefore, I believe it to be of some importance that we attempt to understand why.

The continuance of physical structure is dependent on an underlying force of energy to maintain the integrity of those structural dynamics involved without which the physical structure would collapse. And should the physical structure collapse, the physical structure would simply vanish from sight.

The relative relationship existing between all the constituent components of universe, in terms of the non-simultaneous condition of universe remaining relative to the system of reference, constitutes the non-absolute condition of the present moment. Therefore it is important to realize the non-absolute nature of universe, in terms of time, space and motion.

If there is no absolute present moment there is no absolute space or absolute motion, as such things are quite impossible in terms of a relative universe. To suggest otherwise

defies the basic theoretical principles of relativity and defies the very existence of a relative universe.

This is why Einstein developed a four dimensional space/time continuum, as without the element of time the corresponding space would not exist. But the mistake Einstein made was to perceive the universe existing as a static condition rather than as a dynamic condition.

This was his Achilles heel in that he failed to follow his own logic. I can only speculate that he was in some way inhibited to step beyond the boundaries of his own convention, which might sound ludicrous to anyone who has not attempted to walk the walk.

Unfortunately by the time he realized his error the influences of the times were already extending the boundaries he had previously set, but they were extending those boundaries on the basis of an error whereby they assumed the existing model to be correct, in relation to the physical structuring of universe.

This in itself was and still is a critical consideration, which ultimately affected scientific history in relation to the existing principles defining atomic energy.

The concept of atomic energy is based upon a perception of understanding determining energy being proportional to mass, in that the idea hinges on the assumption that an increase in mass affects a proportionate increase in energy, which is determined on the basis of a linear relationship involving the speed of light.

A proportionate ratio of energy to mass cannot be determined or evaluated in terms of a linear relationship, as no such relationship exists other than as an abstract idea.

The existing perception of atomic energy does not correspond to a force of energy but corresponds to an inverse factor of resistance associated with the underlying force of energy determining the form and function of physical structure.

In other words, what we refer to as atomic energy is not atomic energy at all, but atomic resistance, which increases inversely to a proportionate decrease in energy.

So when we say that a certain element has a high atomic energy potential we should be saying that it has a low energy potential and a high potential of resistance to a further increase in energy, which is the exact opposite of what Einstein intended to convey in his famous equation $E=MC^2$.

We must learn to identify energy, true energy, for what it is and not for something we think it should be.

Our economy is based on the consumption of fuels and resources necessary to drive our industry, an idea which does not allow for a sustainable future. And the reason for our

dependence on consumable fuels and resources is due to nothing less than our existing perception of energy.

If we consider the true energy potential associated with hydrogen we are on the right track, as hydrogen has the highest underlying energy potential of any known element in relation to the ratio of energy per unit of mass affecting the form and function of hydrogen.

Therefore, is it any wonder that water is so important to our survival and the various processes of life? Water is two parts hydrogen to one part oxygen, which provides for a relatively stable structure very high in energy. And when you think about it.....water is an absolutely incredible material.

So why would we consider it unreasonable for water to be utilized to fuel our industry? After all, it does fuel our biological existence and most of the life forms on our planet?

I'm afraid the answer is somewhat long and complex, but in very general terms; water as a fuel would allow all the people of the world to function on a fairly level playing field. Water would provide an abundant and inexpensive fuel, in the form of a non-polluting renewable resource.

Of course, water is not the ultimate ideal, but it is a start in the right direction. Because, if we can understand and appreciate the benefits of water as a fuel we can also understand the true nature of energy and our ability to develop a fuel-less economy, meaning no fuel of any kind.

A fuel-less economy would provide free energy to all people, as the only requirement would be the development of a non-linear time field frequency acceleration modulator.

But first, we must understand why water represents such an efficient fuel supply.

The hydrogen content of water is the key, as there is an extremely high ratio of energy to mass focused to the center of each hydrogen atom, which in turn affects a proportionate factor of resistance radiating isometrically from the nucleus of the hydrogen atom.

There are both internal and external dynamics affecting the structure of hydrogen and both the internal and external dynamics of hydrogen affect inverse responses. We have in every hydrogen atom a basic unified field system, which means there is a total balance of energy and resistance associated with every hydrogen atom.

Anything that affects the external dynamics of a hydrogen atom equally affects the internal dynamics in an inverse manner. So we have two opposite but equal responses occurring, as both the internal and external dynamics remain in balance.

The combustion of hydrogen affects an increase in the resistance of each hydrogen atom involved, but equally affects an increase in the ratio of energy per unit of mass affecting each hydrogen atom involved.

This allows more energy on the inside and more resistance on the outside, which accounts for the displacement affecting the motion of an engine's pistons.

This would also mean that less fuel was required to do the same work as a conventional gas or diesel engine.

In basic terms of understanding, the combustion of hydrogen increases the ratio of energy per unit of mass associated with each hydrogen atom while automatically increasing the relative space and motion associated with each hydrogen atom.

In other words, the condition of universe remaining relative to each of the individual hydrogen atoms expands at a rate of acceleration proportional to the increase in energy affecting the structural dynamics of each hydrogen atom.

This is a very simple concept as there is a relative relationship existing between each atom and the host field in which each atom exists. This relationship can be viewed in terms of a differential in non-linear time field frequency acceleration existing between each atom and the host field.

The same is true of molecules, such as molecules of water, as the relative state of water is dependent on its relationship to the environment of the host field in which it exists.

From this, I hope the use of water as an efficient fuel can be clearly understood, as the future of our civilization will be determined on the basis of alternate energy sources.

Yet, water powered motors are not the ultimate possibility, as there is more.

To utilize the natural energy of universe does not require the consumption or conversion of a fuel in the form of a gas, liquid or solid. Natural energy can be applied directly without the medium of a fuel, as fuel-less propulsion is the ultimate goal.

In order to apply the underlying energy of universe directly, requires a process of focus allowing for the controlled modulation of non-linear time field frequency acceleration.

Such a process is not nearly as complicated as one might imagine, in fact, it's fairly simply.

A field frequency modulator is modeled on the structure of the atom and or the solar field system, which requires the construction of a self contained unified field system. What we are talking about here is an enclosed shell containing a focus mechanism in the form of a magnetic frame.

The magnetic frame acts as a lens to focus the energy of the enclosed system relative to the field or the environment in which it is located, which in turn affects a differential in energy and resistance between the enclosed system and the field or environment in which it exists.

So what would it look like?

Project Unity is a field frequency modulator, as shown at <http://gravitycontrol.org/projectunity2.html>. Here we can see four horizontal rings of circular magnets.....with each rings being made up of a number of individual magnets.

This looks much like a funnel or cone, with the mouth of the cone at the top of the funnel. Manipulation of the magnets affect the focus of the system's field, where the individual magnets can be turned from side to side and up and down in sync. This process allows for the focus of the system's field and the controlled modulation of the system's underlying energy.

This system could be compared to a pyramid formation in that the non-linear time field frequency acceleration modulator is an inverted pyramid that is turned inside-out to form a stepped cone.

You could say that what this represents is a field within a field, just as every atom constituting the known universe exists within the field of the earth. Consequently every atom of universe remains relative to the earth as the system of reference.

The amazing simplicity of this provides for both a gravitational and an electromagnetic response.

An electromagnetic potential is simply a matter of an energy differential existing between two or more systems, and/or, a series of individual systems wherein the greater the differential the greater the response.

Therefore, a gravitational response or an electrical response is determined on the basis of an energy differential.

It should be emphasized that there is a distinct difference between our conventional perception of physical structure and that which is being presented, as physical structure involves differentials in non-linear time field frequency acceleration affecting both form and function.

The continuance of each individual system of universe moves at different time rates which are determined on the basis of non-linear time field frequency acceleration. This allows for an infinite number of non-uniform relationships to exist simultaneously and remain relative to the system of reference.

Therefore, both past and future conditions are involved simultaneously in respect to the condition of universe remaining relative to the system of reference.

This would suggest that the idea of a linearly defined limit affecting supply and demand might be less than accurate as both past and future exist simultaneously. Therefore, all that has been exists indefinitely, and, all that will be also exists indefinitely, which represents a very large amount of physical structure being available at any given moment in time.

Without realizing it, we have restricted ourselves in a very confining manner, as we have felt it necessary to argue and fight over the available resources. But if there is no limit to the available resources, in terms of both energy and material, there is no reason to argue and fight.

This would suggest an unlimited abundance being readily available to all people.

In terms of energy, there is no limitation as the available energy sustains and perpetuates the existence of the universe, and, if that is not enough there is more. There is also a condition of universe remaining relative to each and every system of universe which is equally perpetuated and sustained on the basis of the energy associated with each of those systems.

Now, in my mind, that is one whole lot of energy. But there is still more as the underlying energy of each system is increasing at an accelerative rate. Consequently, there is more energy available today than there was available yesterday and there will be more energy available tomorrow than what is available today.

If we spent thousands of years calculating, we would not come close to determining the available energy, there is just that much of it.

Yet, here we are worrying about running out of oil. We don't need the oil; we never did need the oil, as we can function very nicely without it.

What we need to do is remove our blinders and take a closer look at the possibilities available to us. We have choices, reasonable choices which are more than capable of providing for our human industry and our personal needs.

The water car is a great start, but it's not the end-all...it's just the beginning of our future.

There is no existing system on the planet that cannot be adapted to function efficiently on water based fuel. And, there is no existing process or system which cannot be adapted to function efficiently on the basis of a fuel-less energy supply.

It's up to us as individuals to determine our own destiny, but collectively we must at least take a forward view of the situation and realize the limitations we have adopted in attempting to define the universe in terms of linear proportions.

Of course, linear proportions are required for many purposes including the construction of a water car or a field frequency modulator, but the basic dynamics of universe are not linearly based and cannot be effectively approached on the basis of linear proportions.

As radical as this might sound to some of you, we have yet to realize our human potential. We have yet to realize our relationship with universe and to realize the potentials available.

We must at least attempt to move beyond our restrictive mind set and consider new ideas. And of course there are challenges to overcome, lots of them, but not only do we have the potential to survive but the potential to prosper as a global community.

The choice is ours to make.

All that is required is the desire and the motivation to move forward.
